

Fishing Ecosystem Analysis Tool (FEAT)

Stewart Allen

Human Dimensions Research Program
Pacific Islands Fisheries Science Center

**NOAA
FISHERIES
SERVICE**

2012 Hawaiian Islands Symposium

What

Transforms inaccessible databases of commercial and recreational fisheries catch into useable spatial displays

Links fisheries catch patterns with socioeconomic conditions

Incorporates a simple front end for painless queries

Masks confidential data to allow eventual use via the web

Why

Scientists, managers,
Council, communities and
fishermen desire better
access to fishing data

Incorporating
socioeconomic data
gets people thinking
about people and
ecosystems

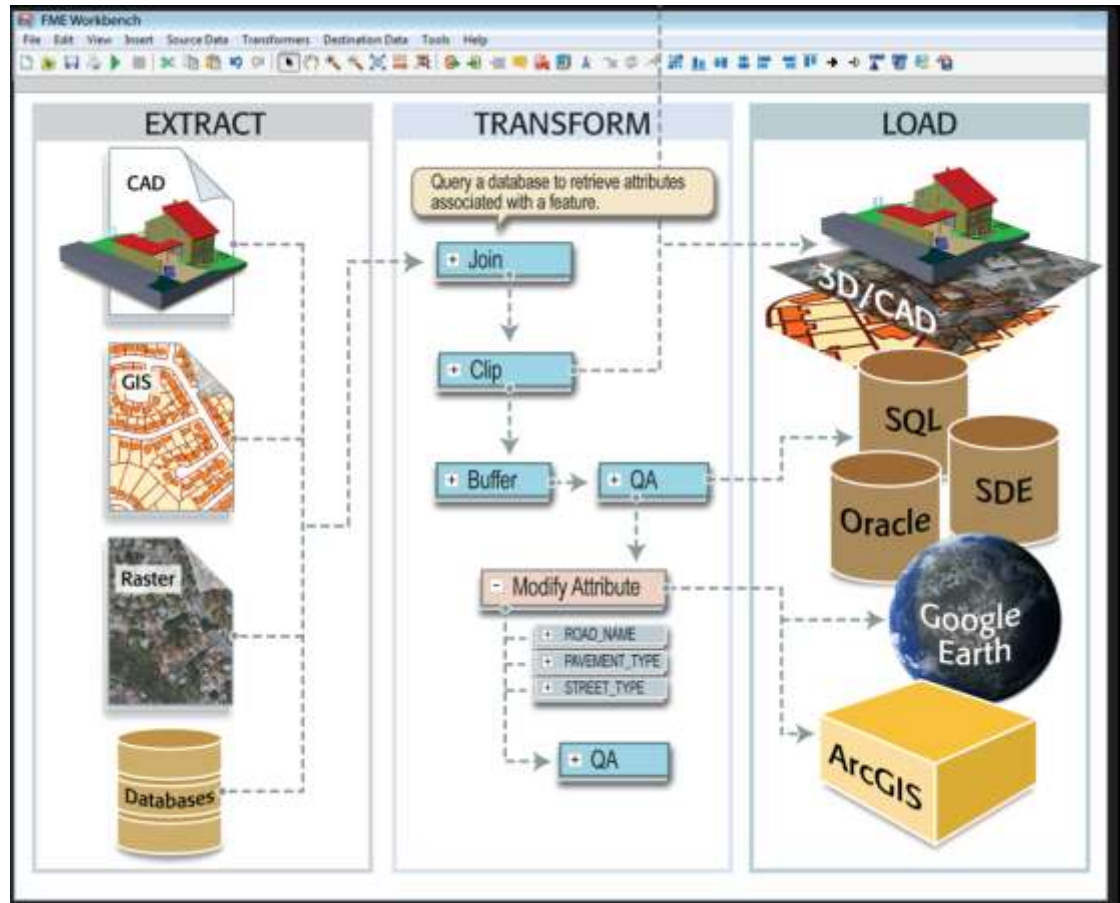

How

FME, available from Safe Software (safe.com)

FEAT input:

Commercial Marine License non-longline logbook data (1994-2011);
Hawaii Marine Recreational Fishing Survey data (2004-2011);
U.S. Census data (2000, 2010)

FEAT output: KML, GeoPDF, Excel, shape files

Who

Stewart Allen, Leader, Human Dimensions Research Program, PIFSC, Honolulu

First version (ArcGIS-based) developed by Allen and NOS employee Kyle Ward on rotational assignment to PIFSC, 2007

Refined with Matt Austin, NOS, on rotational assignment to PIFSC, 2009

Refinements currently being made under contract by Makai Ocean Engineering, Waimanalo

Where

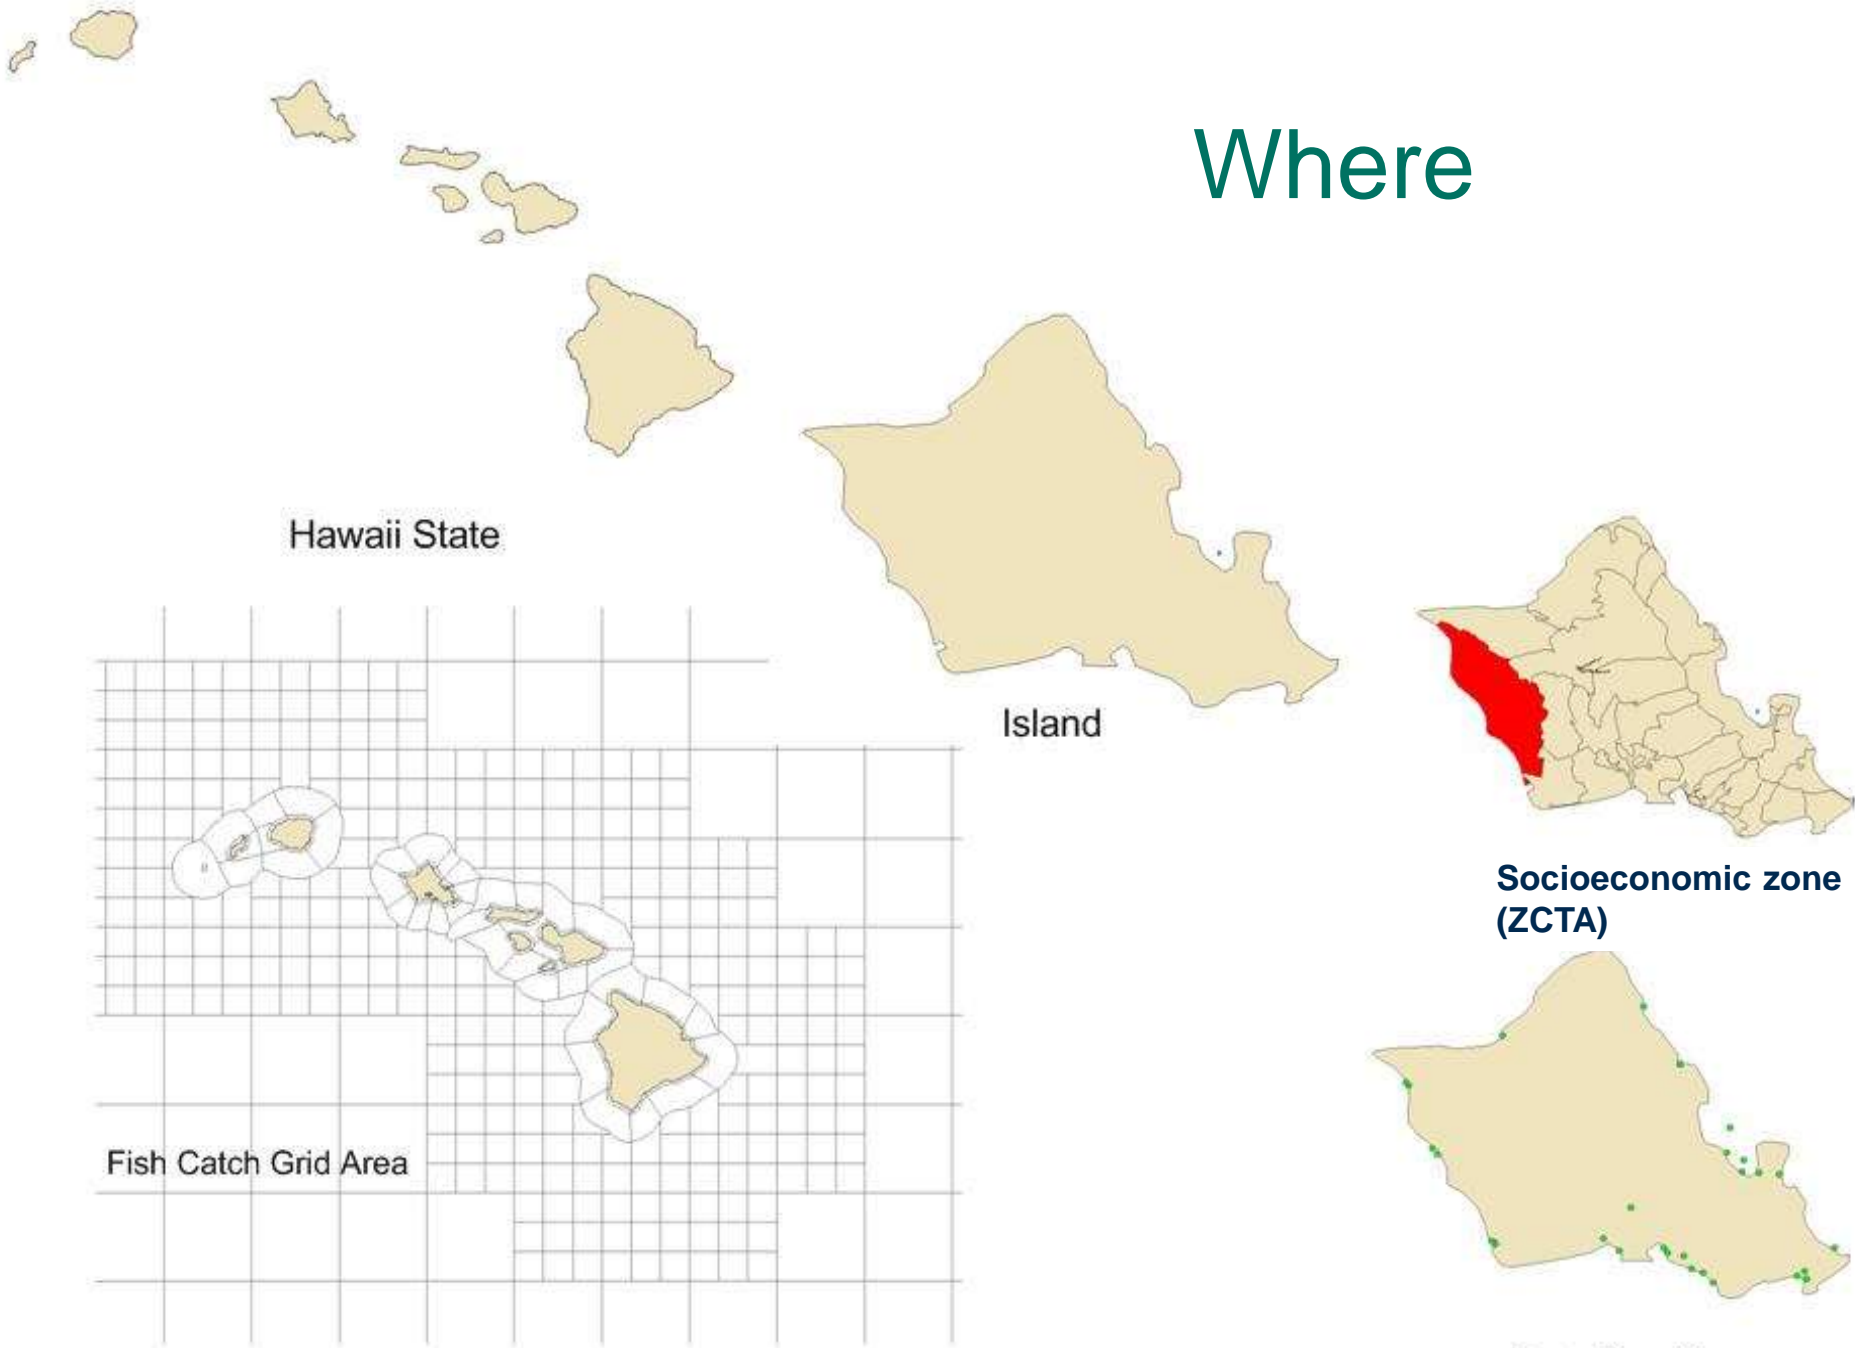

Hawaii State

Island

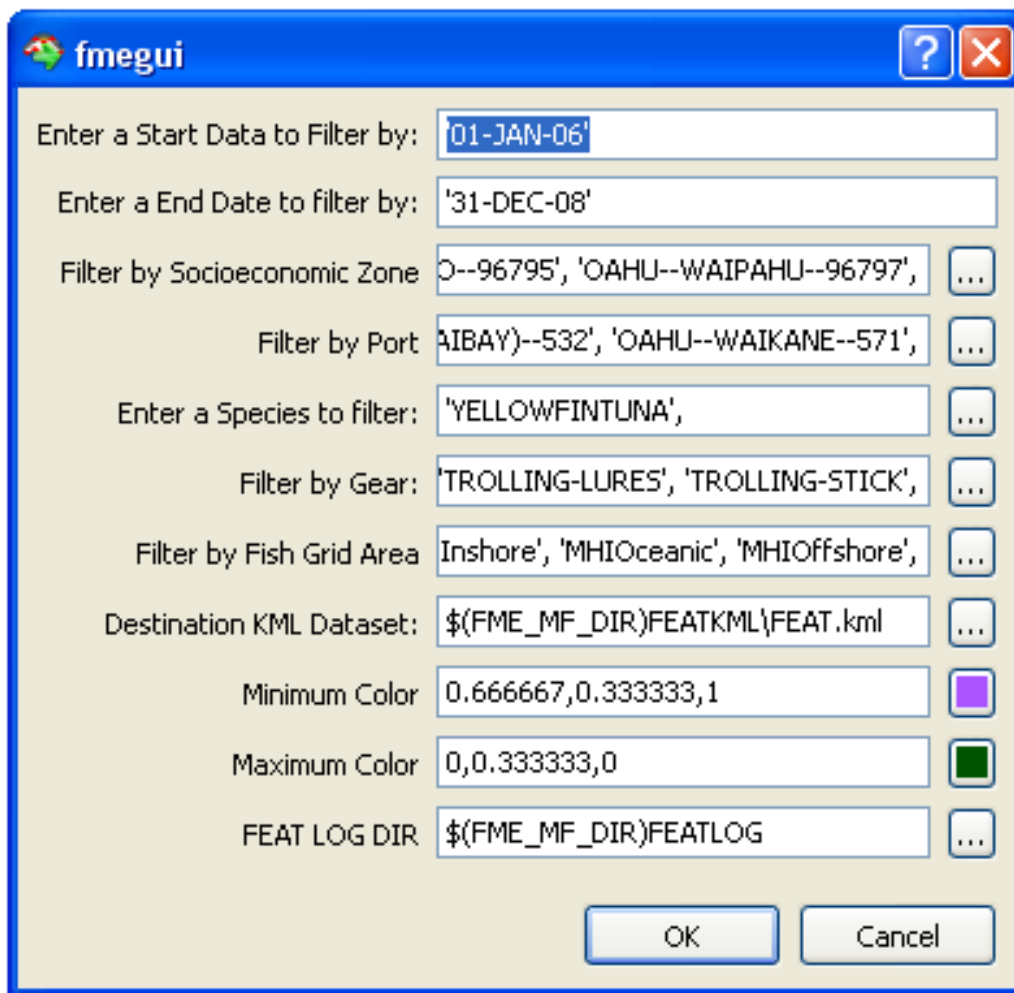

Socioeconomic zone (ZCTA)

Fish Catch Grid Area

Port of Landing

The front end, showing a query asking for the pounds of yellowfin tuna caught commercially in 2006-2008 by Oahu anglers using trolling gear in all ocean locations and landing at any port

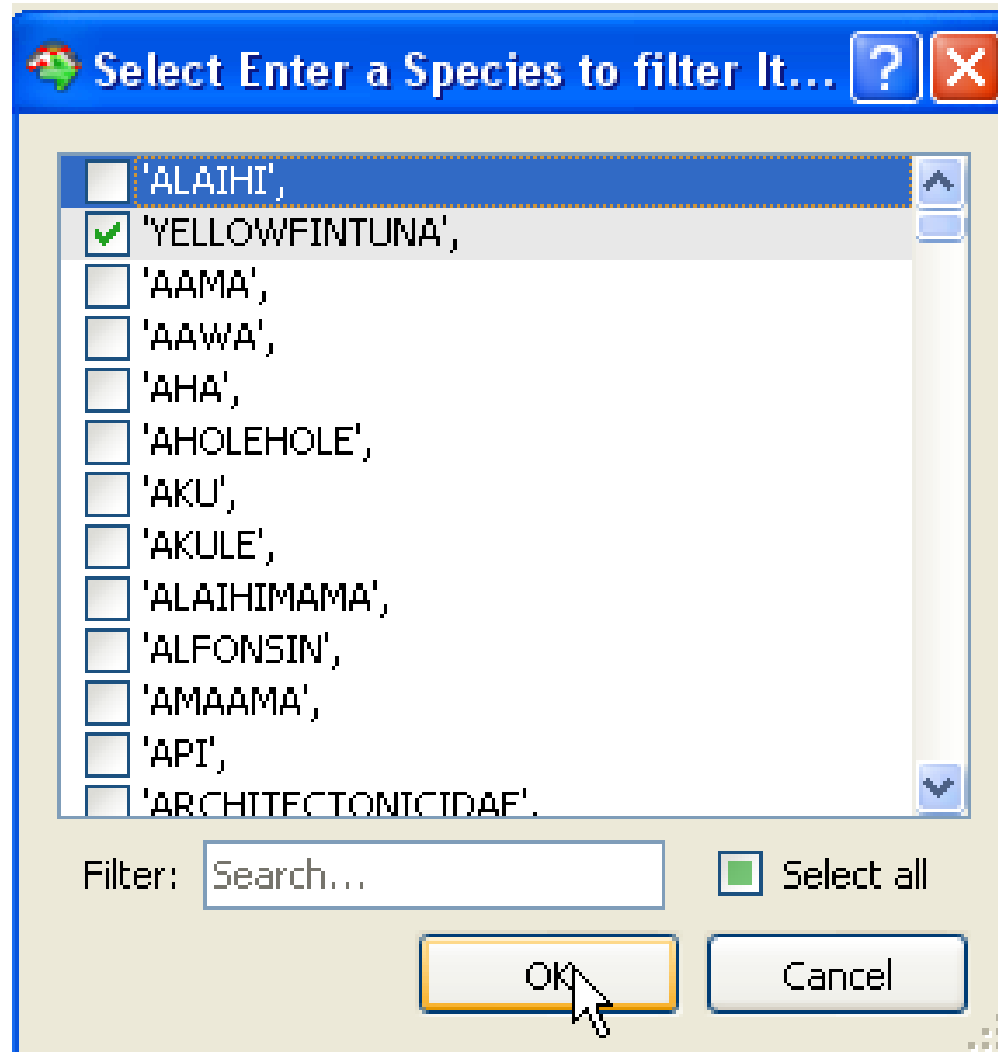

The screenshot shows a dialog box titled "fmeGUI" with a blue title bar. The dialog contains several input fields and buttons for configuring a query. The fields are as follows:

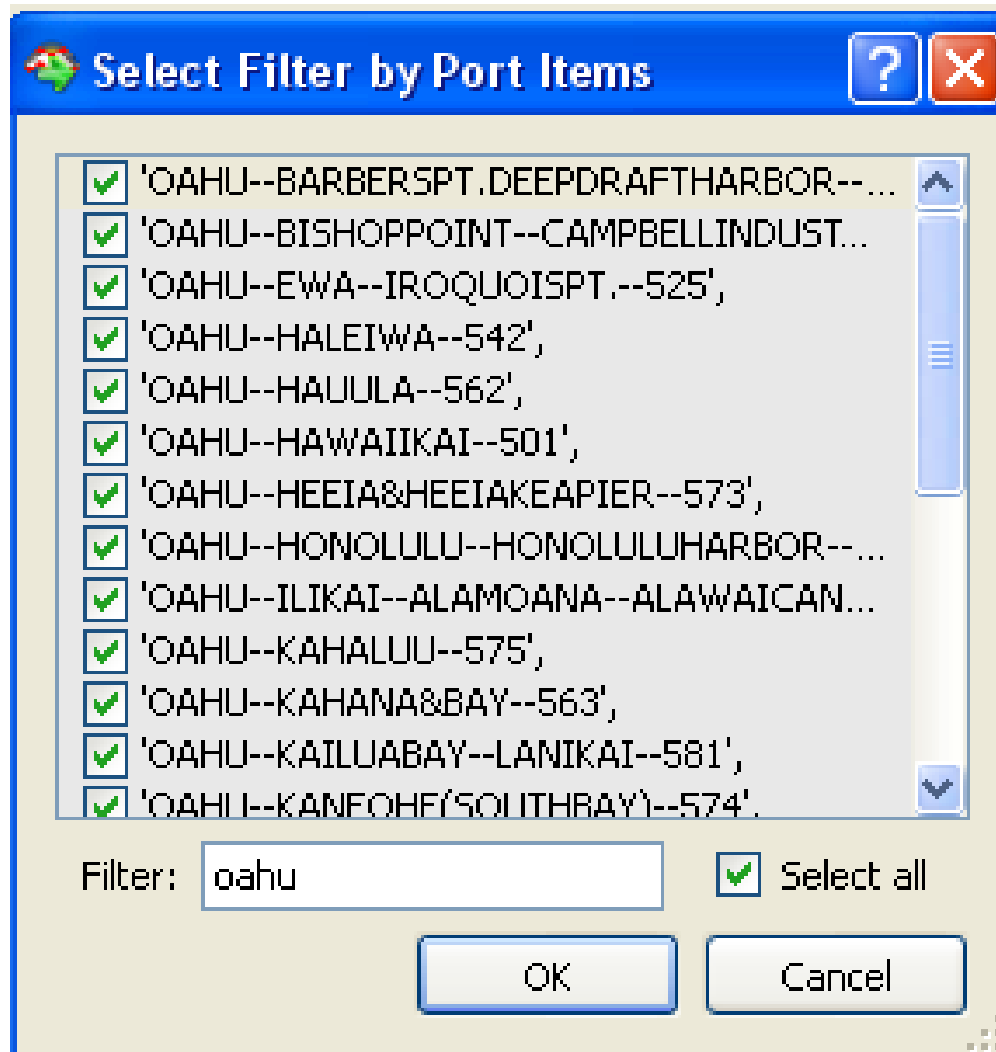

- Enter a Start Date to Filter by: 01-JAN-06
- Enter a End Date to filter by: '31-DEC-08'
- Filter by Socioeconomic Zone: O--96795', 'OAHU--WAIPAHU--96797', ...
- Filter by Port: AIBAY)--532', 'OAHU--WAIKANE--571', ...
- Enter a Species to filter: 'YELLOWFINTUNA', ...
- Filter by Gear: 'TROLLING-LURES', 'TROLLING-STICK', ...
- Filter by Fish Grid Area: Inshore', 'MHIOceanic', 'MHIOffshore', ...
- Destination KML Dataset: \$(FME_MF_DIR)FEATKML\FEAT.kml ...
- Minimum Color: 0.666667,0.333333,1 (with a purple color swatch)
- Maximum Color: 0,0.333333,0 (with a green color swatch)
- FEAT LOG DIR: \$(FME_MF_DIR)FEATLOG ...

At the bottom of the dialog are two buttons: "OK" and "Cancel".

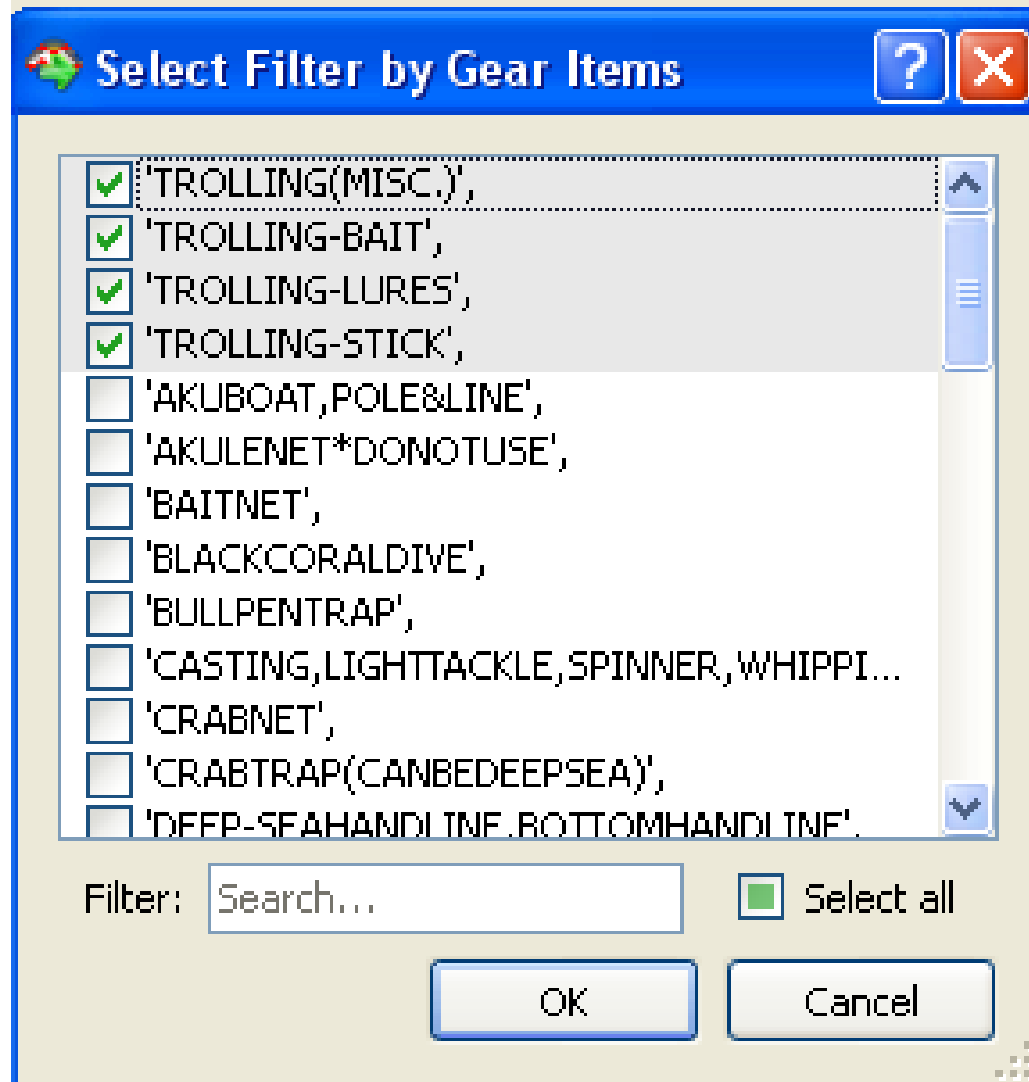

Yellowfin tuna was chosen from a list of 200+ species, which can be selected individually or in any combination (for example, Deep 7 bottomfish)

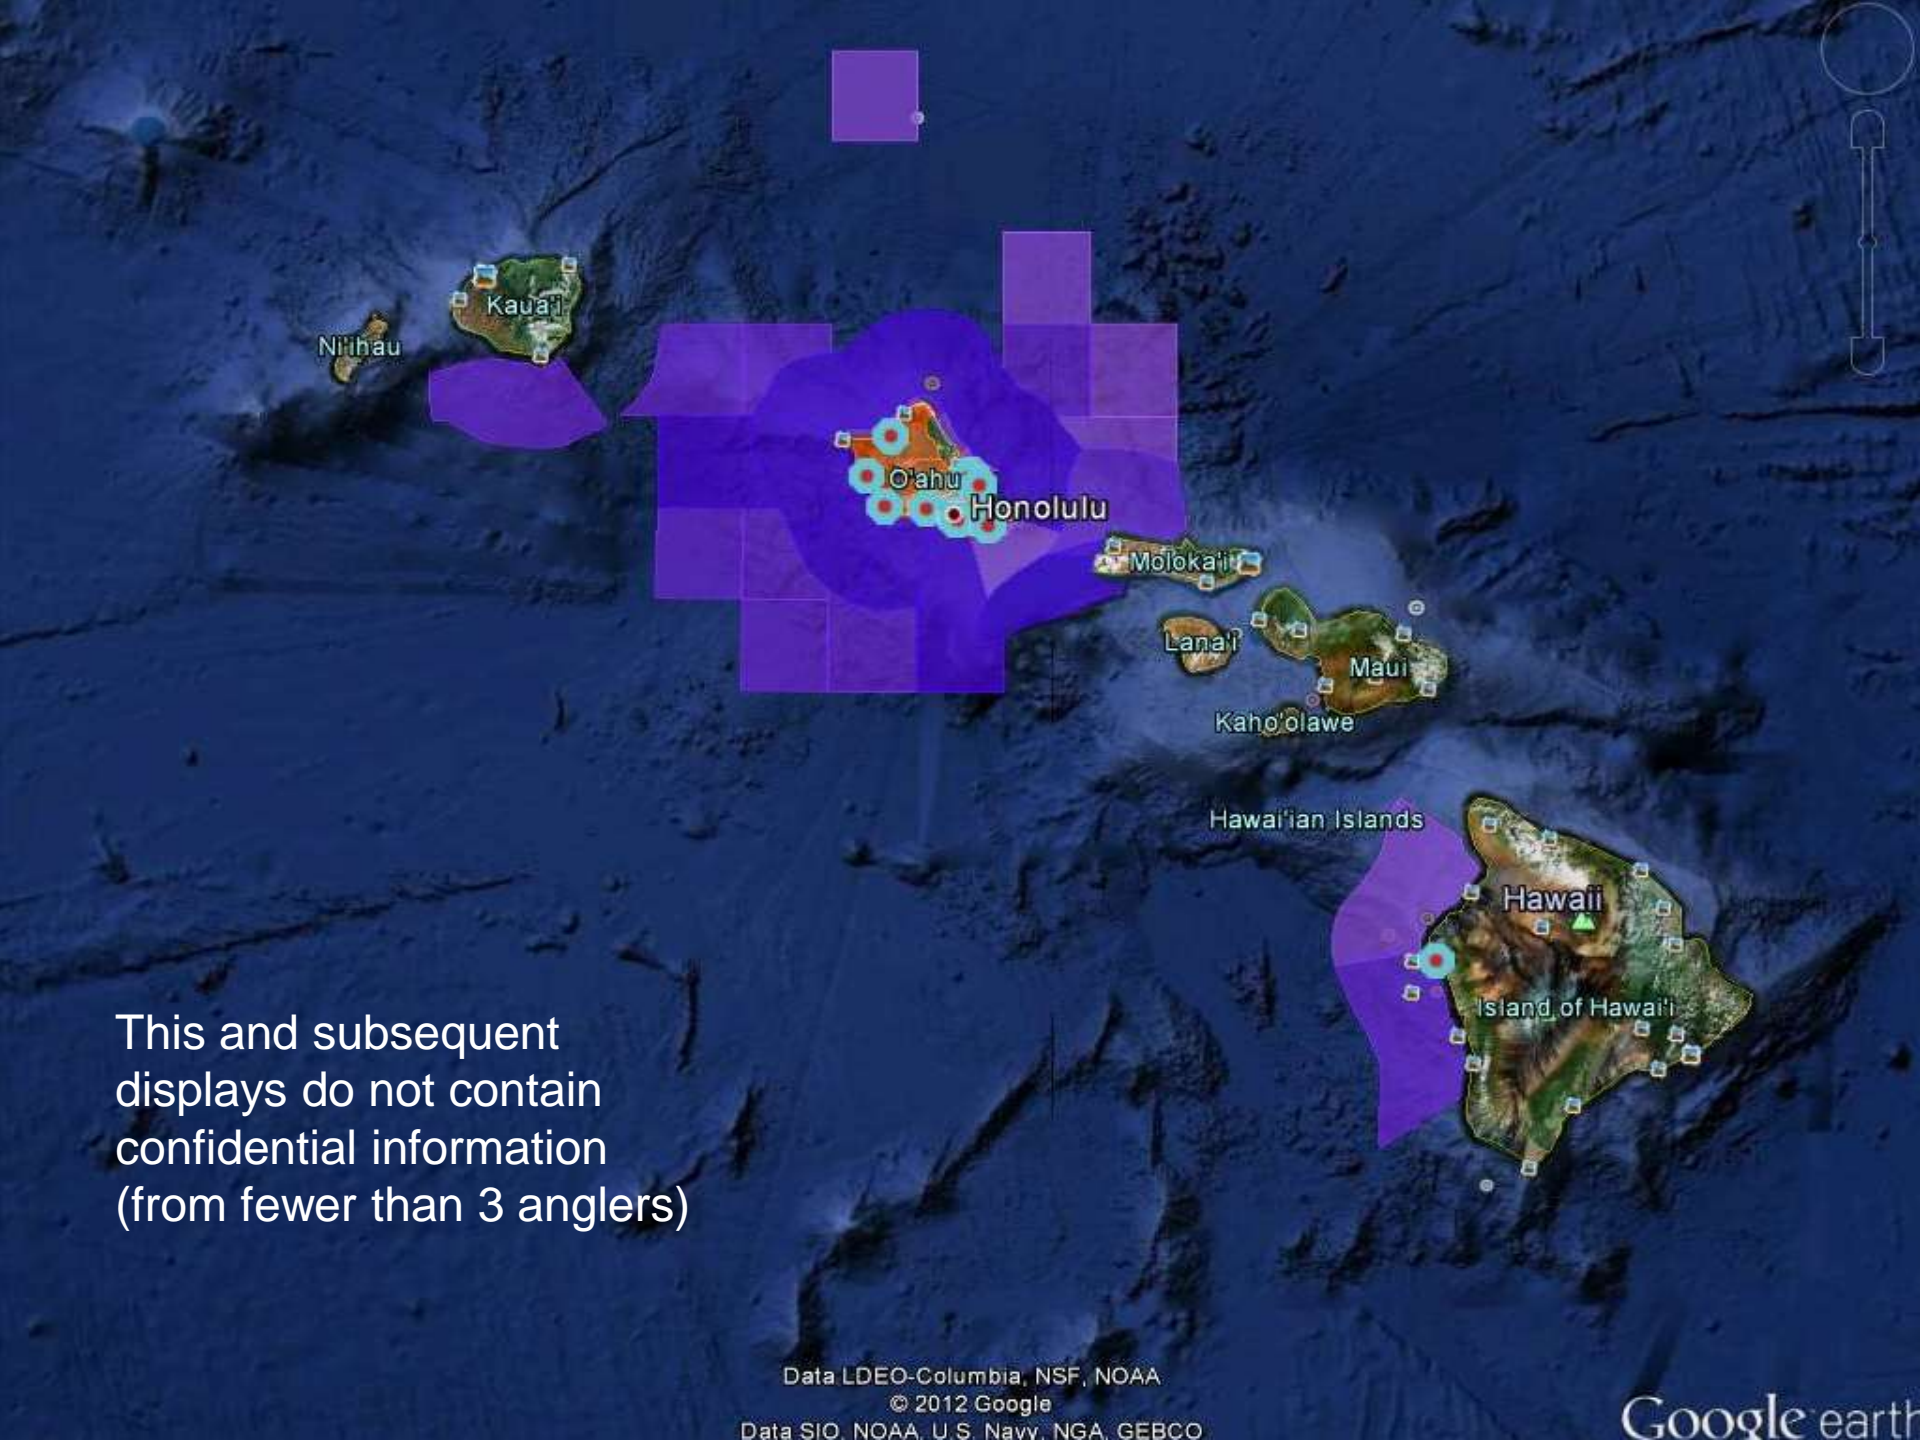

Oahu anglers were chosen from a list of socioeconomic zones (ZCTAs); it's easy to select the state, an island, individual socioeconomic zone, or a combination

Trolling gear was chosen from a list of 42+ gear types, which can be selected individually or in combination

This and subsequent displays do not contain confidential information (from fewer than 3 anglers)

Percent Who Are Two or More Races	41	↓

FEAT also can do recreational fishing queries using onsite interview data from the Hawaii Marine Recreational Fishing Survey

Sample data
(not “census”)

No location of catch (not
problem for shoreline
fishing queries)

Next Steps

1. Transition to web-based application (FME Server) for widespread use
2. Revise based on user feedback
3. Implement in other regions
